# Superstore Sales Analysis

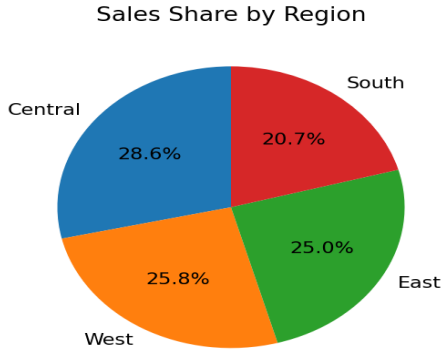

## Task 2: Data Visualization and Storytelling | Visual report

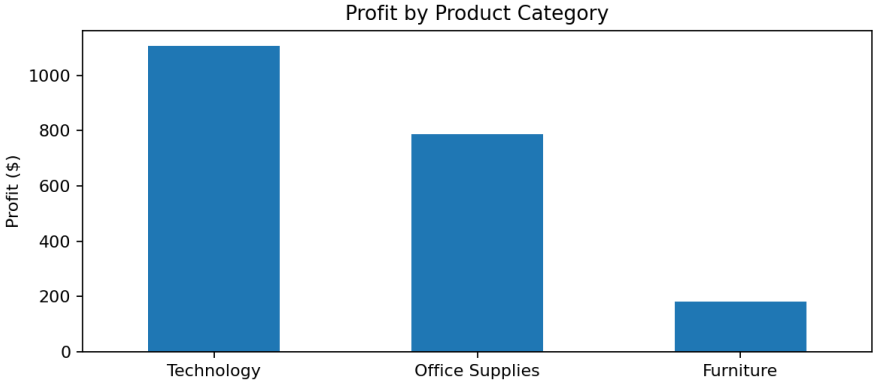

Dataset note: This is a practice dataset generated for this project. It is synthetic and does not represent a real company or actual customer transactions.

| Total Sales | Total Profit | Orders | Average Discount |
|---|---|---|---|
| $23,363.77 | $2,076.56 | 600 | 12.5% |

# Business Insights and Interpretation

1. Technology generated the highest sales among the three product categories ($8,358.68).

2. Central contributed the largest regional share of sales ($6,677.18).

3. Technology produced the highest total profit ($1,106.93).

4. The highest-sales month in this dataset was December 2025 ($1,587.22).

5. The average order discount was 12.5%; discount levels should be reviewed alongside profit, not sales alone.

## Recommendations

• Prioritize inventory and marketing for the category with the strongest sales, while checking whether it also maintains healthy profit.

• Compare regional sales with profit and order volume before allocating additional budget.

• Review high-discount orders to identify discounts that increase revenue but reduce profitability.

• Use the monthly trend to plan seasonal stock levels and promotional campaigns.

Limitations: Findings describe only this generated sample. They should not be presented as real business results. The report is a PDF deliverable; it is not a Power BI .pbix file.
